Reflection on Human-AI Collaboration

CHANG TING WEI · M1461013 · Graduate Institute of Artificial Intelligence, Chang Gung University

Before this assignment, I had some experience building a personal website in a previous course, so the idea of creating a portfolio website was not completely new to me. However, this time I used generative AI much more actively as a collaborator. At the beginning, I provided the assignment requirements, my personal information, and a rough idea of the website structure. I then asked AI to help organize the content and generate the main website, including the HTML, CSS, layout, and responsive design.

The biggest advantage of using AI was speed. It saved a large amount of time when creating the basic website structure and arranging the visual layout. Instead of writing every section and style rule from the beginning, I could start from a working draft and focus on checking whether the result matched the assignment requirements and represented me correctly. AI was also useful for turning my short Chinese descriptions into clearer English content, especially for the About section and my undergraduate project on a pose-recognition exercise application.

At the same time, I found that AI output could not be accepted without review. Some generated descriptions sounded too exaggerated, and AI sometimes added experiences or achievements that I had never done. I therefore removed unsupported information and revised the project description so that it only reflected my actual work, including motion detection, scoring-algorithm design, and software development. I also chose not to use a personal photo and preferred a cleaner technical visual style. I checked the overall layout, navigation, English wording, mobile presentation, and whether the required sections were included.

This process made the limitation of AI very clear to me. AI can generate content and code quickly, but it does not automatically know which statements are accurate or appropriate for a specific person. Human judgment is still necessary to verify facts, decide what should be published, and evaluate whether the design fits the intended purpose. If I do a similar assignment again, I would give AI more precise constraints at the beginning, separate content generation from design tasks, and verify each major output before continuing. I learned that AI is most useful as a fast development partner, while the user remains responsible for the final decisions and quality of the work.
